Abstract :

Our team is interested on how signaling pathways control of adult skeletal muscle plasticity. In the past years, we focused our attention on Srf transcription factor which is one of the three master genes that controls myogenesis in *Caenorhabditis elegans*, together with MyoD and HAND. We investigated the role of Srf in two cellular compartments of mouse skeletal muscle (myofibers and adult muscle stem cells) upon different perturbation of muscle homeostasis (hypertrophy, atrophy, regeneration). In the present seminar, I will summarize our findings concerning the role of Srf in myofibers to control muscle mass and I will present recent data identifying Srf as a master regulator of muscle stem cell fusion and demonstrating the implication of F-actin architecture in this process.
